

Study Overview

Brief Summary

The study is testing a new study drug in healthy normal weight Japanese and Caucasian participants after a single dose. The aim of this study is to see if the new medicine is safe and how it works in participants' bodies. Oral monlunabant is a new medicine which cannot be prescribed by doctors; it has previously been tested in humans. The participant will either get monlunabant or placebo or a combination of both. Which treatment the participant gets is decided by chance. The study will last about 49 days in total.

Official Title

Investigation of Tolerability, Safety, and Pharmacokinetic Properties of a Single Oral Dose of Monlunabant in Male Japanese and Caucasian Participants With Normal Body Weight

@seedy19tron

I'm pretty certain monlunabant data tomorrow. Just after the EASO
ESMO hype fading and right before the expected rate cuts on
Wednesday and exactly 4 weeks after primary completed.
